Bed types that suit each model Leg Lifter

	МК3	MK3L
Mattress thickness Min / Max	110 - 451 mm	110 - 242 mm
Min floor to mattress height :	535mm	374mm

MK3

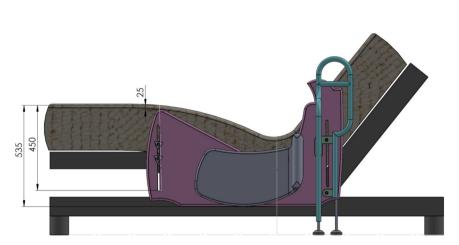

Mattress thickness: 110 - 451 mm

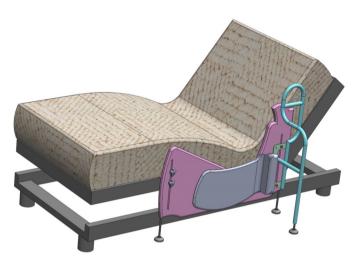

Min floor to mattress height: 535mm (The slot in the MK3 is longer than the MK3L, making the MK3 more suitable for beds with a thicker mattress)

Innerspring bed. In NZ these beds are 500—550 mm floor to top of mattress and require the Std U shaped stability bar and back fixing. In the USA these beds are normally 550 - 700 mm. The bottom part of the bed being made into draws and used for storage.

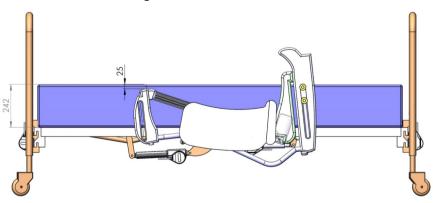

Comfort bed. In NZ these beds are sold through bed retail shops. Typically they have a memory foam mattress and a fixed base that does not raise or lower. The best way to fix the Leg Lifter to the bed is with one straight stability bar and Back Fixing at the foot end so the foot end of the Leg Lifter can raise and lower as the mattress profiles. Support the handle end with a transfer rail and tie the base of the handle end of the Leg Lifter to the side rail of the bed with a cord.

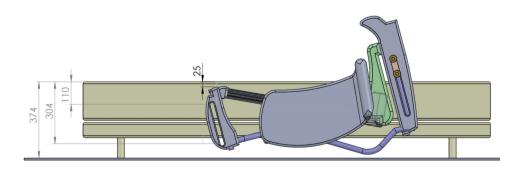

MK3L

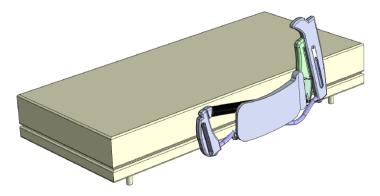

Mattress thickness: 110 - 242 mm Min floor to mattress height: 374mm

Adjustable Hospital bed. In NZ these beds are sold through the likes of Cubro and Invacare. They have a rectangular steel side rail where the MK3L can fit to by using the Profile Bed Clamps (providing that the size of the Side Rail has a cross section no deeper than 62mm. Larger size side rails would need a customise clamp with a wider spacing between the threaded bosses)

Slatt bed. These are very low beds and sometimes require the Leg Lifter to be angles downwards. These beds are very common in Europe and that is why Lewel Plus and HomecareInnovation buy the MK3L. Lewel Plus make up their own fixings and we send them our back fixing. HomecareInnovation either use the Std Mk3L stability bar or our Profile Bed Clamp with Back Fixing.
